

Sexual and gender-based violence in Central Asia

PREVALENCE DATA

Quality and comprehensive data on experiences of victimization, scope, nature and consequences of sexual and gender-based violence (SGBV) are crucial for effective policymaking. Such data can raise awareness on SGBV in society and increase duty bearers' accountability in preventing and combating this type of violence. It allows for the design of evidence-based measures and to monitor the implementation and effectiveness of legislation, policies, and other actions to tackle violence over time.

Dedicated surveys are the best way to get a comprehensive approach to SGBV prevalence data, but frequent, cost-effective, alternatives are to integrate SGBV modules in existing surveys, such as Multiple Indicator Cluster Surveys – MICS, Demographic and

Health Surveys – DHS, or health or general crime surveys. However, violence against women is still highly underreported.

This publication provides a summary of the available data on the prevalence of SGBV in Central Asian countries (Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan) from SGBV-dedicated surveys and broader surveys which include SGBV modules conducted in the region. This data may inform and assist decision-makers and stakeholders, at sectoral level (particularly, law enforcement, social sector and healthcare sector, as well as gender and statistics offices of the governments) to improve the quality and availability of SGBV prevalence data.

Sexual and gender-based violence (SGBV)

“ All acts of gender-based violence that result in, or are likely to result in, physical, sexual, psychological or economic harm or suffering to women, including threats of such acts, coercion or arbitrary deprivation of liberty, whether occurring in public or in private life. ”

“ Violence that is directed against a woman because she is a woman or that affects women disproportionately ”

“ Violation of human rights and a form of discrimination against women ”

Council of Europe Convention on preventing and combating violence against women and domestic violence, 2011. ¹

In this publication, the term sexual and gender-based violence (SGBV) is understood to comprise the following forms:

DOMESTIC VIOLENCE

family violence and abuse, intimate partner violence

SEXUAL VIOLENCE

limited to rape and sexual assault

HARMFUL PRACTICES

limited to early marriage, bride kidnapping

Types of SGBV data

Administrative data

- Collected through day-to-day delivery of services in institutions
- Used mainly for internal purposes
- Can provide information on the capacity of institutions to protect and support victims, as well as to prosecute perpetrators
- Encompasses only violence which is reported to these institutions and does not represent the full extent of the problem

Prevalence data

- The best source for estimating the prevalence of VAW are population-based surveys
- Capture the responses of people who have reported SGBV/sought helped, as well as of those who have not
- Provide a proxy to prevalence and not actual prevalence, depending on survey sample design and the respondents' willingness to disclose their experiences of violence

PREVALENCE ≠ INCIDENCE

Prevalence data = the proportion of the population that experienced violence in a given period (counts people, regardless of how many occurrences happened to them)

Incidence data = number of new episodes in a given time (even if perpetrated against the same person)

These types of data are different but complementary.

Standards for prevalence data

Definitions used in the survey should be consistent with international recommendations, in order to facilitate population of common indicators (i.e., SDGs indicators) during data processing stages.

Defining the target population is crucial to obtaining prevalence data. Sample design is a complex process that should ensure representativeness, considering all population who could be victims of violence.

It is recommended that only women aged 15 and above are considered, to avoid confusion between GBV and other types of violence against children, issues with validity of consent, inter alia. ²

Besides focusing on experiences of victimization, surveys might also cover attitudes and perceptions

of violence, as well as issues related to disclosure and barriers to seeking help. ²

Surveys should integrate both quantitative and qualitative approaches to draw the most comprehensive conclusions possible.

Ethical and safety considerations should be a priority, to ensure privacy and confidentiality at all stages and guarantee data anonymity.

The outcomes of prevalence surveys should be made publicly available and presented in ways that are easily retrievable and useful for stakeholders, policymakers, service providers, advocates, the media and general public. ³

SGBV prevalence data in Central Asia

Data sources considered in this publication are limited to currently available online population-based surveys conducted at national or regional levels in Central Asia, covering the forms of violence that were the focus of the Regional Spotlight Initiative activities. The timeframe selected for the search of data sources ranged from 2011-2022, the period between the landmark adoption of the Council of Europe's Convention on preventing and combating violence against women and domestic violence (Istanbul Convention) and October 2022.

Data on prevalence on intimate partner violence and non-partner violence against women was not available for all countries in Central Asia. Kazakhstan's nationally representative survey on

violence against women can be regarded as a good practice.

Some forms of SGBV, such as harmful practices like bride kidnapping, are less documented. Prevalence estimates of these forms of SGBV were only found in Kazakhstan and Kyrgyzstan.

In many countries, large-scale surveys, such as the Multiple Indicator Cluster Surveys (MICS) or Demographic and Health Surveys (DHS) are valuable (in some cases the only) sources of SGBV prevalence data. In other countries, like Kazakhstan and Kyrgyzstan, other national surveys (such as surveys on public safety and crime and victimization) integrated modules on SGBV, for example on non-partner sexual assault.

Kazakhstan

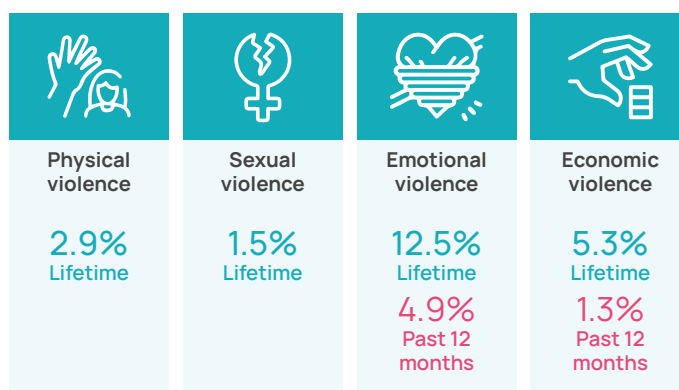

Intimate partner violence

Intimate partner violence experienced by women aged 18-75 years ⁴

Non-partner violence

Violence committed by a non-partner experienced by women aged 18-75 years, since age 15 ⁴

Early marriage

Bride kidnapping

Kyrgyzstan

Intimate partner violence

Intimate partner violence experienced by ever-married women aged 15-49 ⁷

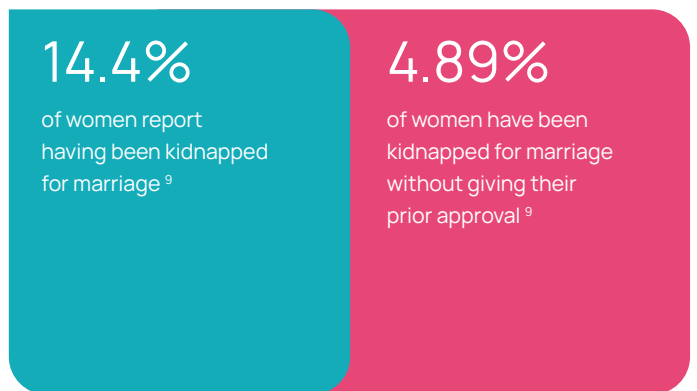

1 out of 4 women aged 15-49 have ever experienced physical or sexual violence ⁷

Early marriage

Bride kidnapping

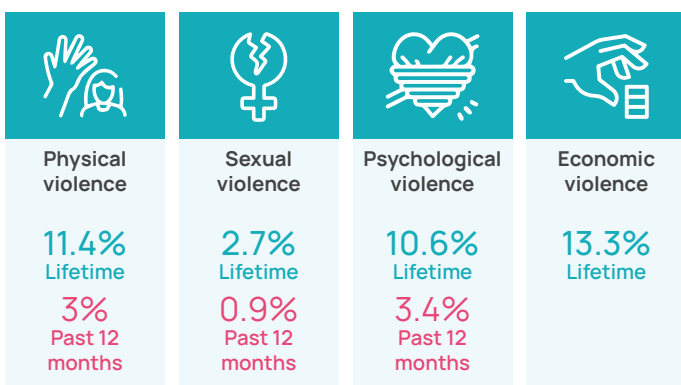

Turkmenistan

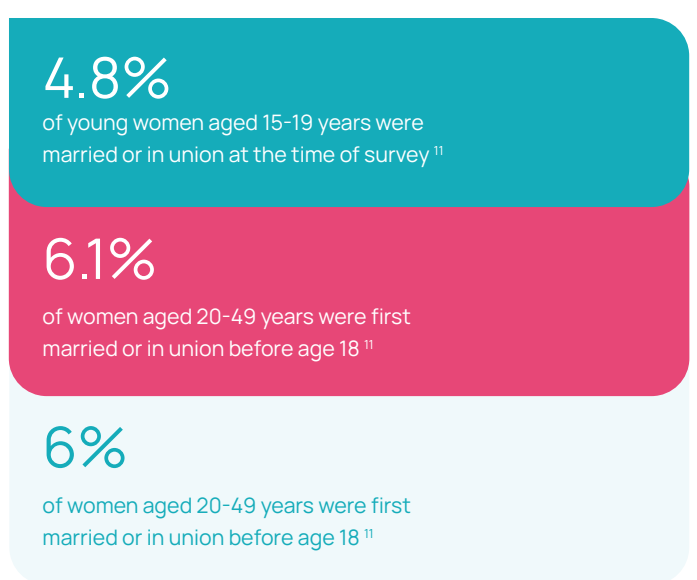

Intimate partner violence

16.1% of women aged 18-59 have been subjected to any form of intimate partner violence during lifetime ¹⁰

Intimate partner violence experienced by women aged 18-59 ¹⁰

Early marriage

Tajikistan

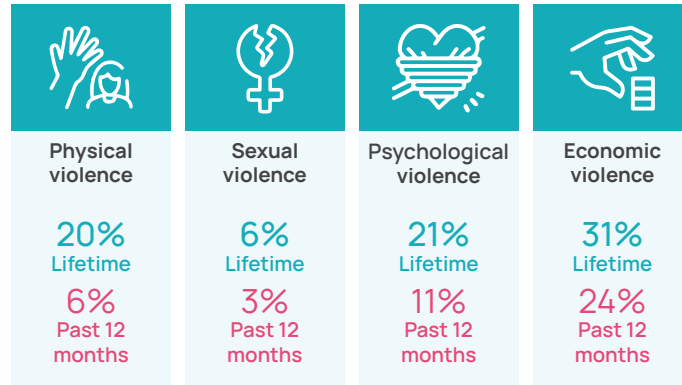

Intimate partner violence

Intimate partner violence experienced by women aged 15-49 ¹²

Violence committed by current partner experienced by women aged 18 and above ¹³

Violence committed by former partner experienced by women aged 18 and above ¹²

1 out of 4 women aged 15-49 have ever experienced physical or sexual violence ¹²

Early marriage

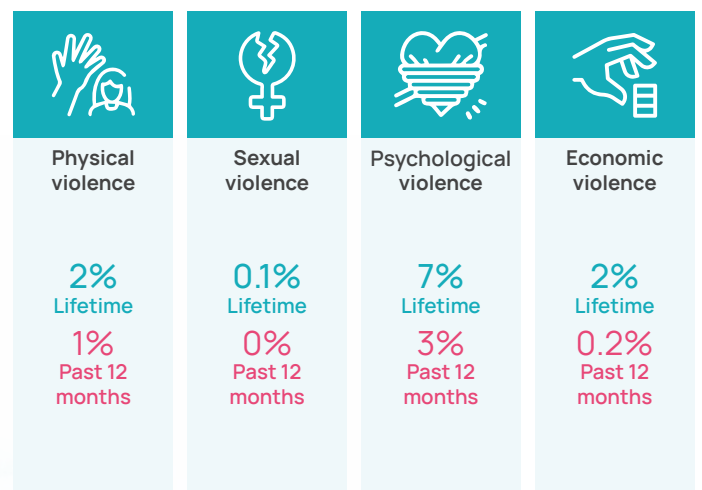

13.3% women aged 25-49 years were married or in a union before age 18 ¹²

1 out of 10 girls aged 15-19 were in a union in 2017 ¹²

Non-partner violence

Non-partner violence experienced by women aged 18 and above ¹³

Uzbekistan

Intimate partner violence

4 out of 10 girls
aged 18-19 years

3 out of 10 girls
aged 15-17 years

consider wife beating
justified for any of the
following reasons: ¹⁴

- she goes out without telling her husband
- she neglects the children
- she argues with her husband
- she refuses having sex with her husband
- she burns the food

Early marriage

4.9%

of women 15-19 years were
married in Uzbekistan in 2022 ¹⁵

Women aged
20-49 who were first married
before 18-year-old
(2007 ¹⁴ compared to 2022 ¹⁵)

2007 - 12.5%

2022 - 8%

Recommendations

- Countries should estimate through surveys the prevalence of intimate partner violence and non-partner violence against women aged 15 and older, in their lifetime and previous 12 months, as well as the prevalence of harmful practices.
- Surveys should assess also other crucial data necessary for effective policymaking, such as use of services and attitudes towards domestic violence.
- International large-scale surveys can be used as model tools to collect data on SGBV against women.
- SGBV modules integrated in other national surveys should be repeated regularly, to provide comparable data over time.

Sexual and gender-based violence in Central Asia. Prevalence data, 2022

This publication was prepared by Sofia Jamal, in consultation with Ionela Horga.

IN
SUPPORT
OF

An initiative of the United Nations funded by the European Union

This document was developed with the financial support of the Spotlight Initiative Regional Programme for Central Asia and Afghanistan. The opinions expressed in this publication are those of the authors and do not necessarily reflect the views or policies of the Spotlight Initiative, the European Union and the United Nations.

The Spotlight Initiative is a global initiative of the United Nations which has received generous support from the European Union. Its aim is to eliminate all forms of violence against women and girls.
